

Accumulated error

run_numerics' running sum of per-instruction error; unbounded

Circuit failure rate

$p_{\text{fail}} = 1 - e^{-E} \approx E$ in this regime

Both panels are the same data. Right = $1 - \exp(-\text{left})$. Below $p \sim 0.1$ the two are equal to within $E^2/2$, so the panels differ only in scale -- there is no saturation to see in this regime.
